

Coreference Resolution

Emory Center of Language and Information Research NLP Reading Group Presentation

Overview

- 1. Significance of coreference resolution
- 2. Connection with NER
- 3. Resolution Structure
 - A. Mention Detection
 - B. Coreference Resolution
- 4. Current Approaches
 - C. Feature-based
 - D. Unsupervised learning
- 5. Progression of Coreference Resolution Models (2007-2009)
- 6. Stanford Sieve System (2011-2013)
- 7. Topics yet to be Explored

Importance

Purposes:

- Finding mentions in text
- Grouping all relevant mentions together
- Referring them back to the real-world entities
- Connecting Entities across sentences
- A preliminary step for knowledge graph generation

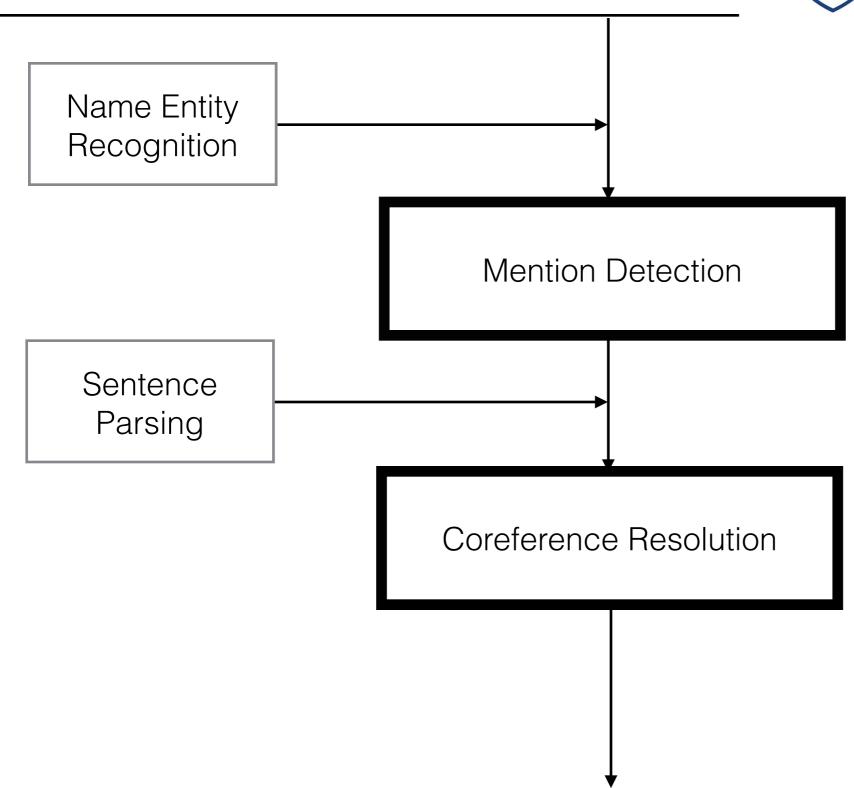

Connection with NER

- NER is a sub-topic of coreference resolution
- Extension to Mention Detection

Structure

Mention Detection

- 3 types of mentions:
 - Name mention
 - Nominal mention i.e. the guy wearing a blue shirt
 - Pronoun mention

Named Entity Recognition:

Person

Henry is presenting coreference resolution at Emory University NLP Reading group.

He feels really stressed there.

Coreference:

Henry is presenting coreference resolution at Emory University NLP Reading group.

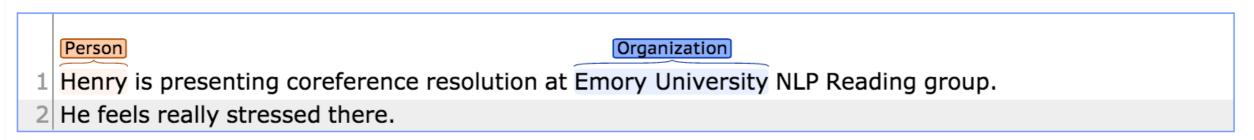

--CorefHe feels really stressed there.

Coreference Resolution

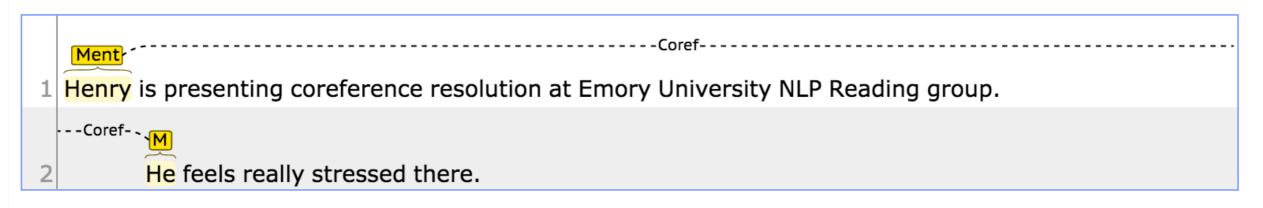

- Grouping of mentions
 - Directed / Undirected
- Merge/Connect entities together

Named Entity Recognition:

Coreference:

Approaches

- 1. Incorporating more feature into the models, such as mention-pair model and cluster ranking models
 - Knowledge sources for the features
 - A. Semantic knowledge sources. i.e. FrameNet, WordNet, etc.
 - B. Annotated corpuses. i.e. ACE, MUC, OntoNotes, etc.
 - C. Unannotated corpuses. (represented in horn rules or relations)
- 2. Shifting from the supervised learning setting to unsupervised learning

Evaluation methods

MUC

- Counts the minimum number of links between mentions
- Cannot represent singleton entities (Only mentioned once)
- Give no credit for separating singleton entities from a chains

B^3

- Overcome the short-coming of MUC score
- Compute precision and recall for all mentions

$$Precision(m_i) = \frac{|R_{m_i} \cap K_{m_i}|}{|R_{m_i}|}$$

$$Recall(m_i) = \frac{|R_{m_i} \cap K_{m_i}|}{|K_{m_i}|}$$

R: Respones, K: Key

Statistical approach (binary classification) (Denis and Baldridge, 2007)

- Asymmetric interpretation (Nguyen and Kim, 2008)
- Symmetric interpretation
- -> Pairwise formulation
- -> feature independence assumption

Cluster-based features

- Convert classification of pairwise models into cluster of mention
- Cluster of mention -> an individual entity (Culotta et al., 2007)

First-Order Probabilistic Models for Coreference Resolution

- Soften the independence assumption of the pairwise model by allowing feature based on first-order logic
- Creating a model over clusters instead of over pairs

$$p(y_{ij}|x_{ij}) = \frac{1}{Z_{x_{ij}}} \exp \sum_{k} \lambda_k f_k(x_{ij}, y_{ij}) \longrightarrow p(y_j|x^j) = \frac{1}{Z_{x^j}} \exp \sum_{k} \lambda_k f_k(x^j, y_j)$$

Training Technique

- Sampling positive and negative examples uniformly using Margin Infused Relaxed Algorithms (MIRA)
- Rank positive example higher than the negative ones
 - -> True mentions in bad clusters are not unjustly penalized

First-Order Probabilistic Models for Coreference Resolution

Result

- 1. Allows to model constraints like: "do not prefer entities whose only mentions are pronouns"
- 2. Introduction of a error-driven, rank-based training technique

	F 1	Prec	Rec
First-Order MIRA	79.3	86.7	73.2
Pairwise MIRA	72.5	92.0	59.8
First-Order Uniform	69.2	79.0	61.5
Pairwise	62.4	62.5	62.3

Unsupervised Coreference Resolution in a Nonparametric Bayesian Model

- 1st unsupervised method that perform as good as supervised approach
- Proposed a hierarchical Dirichlet Process to find the referents of mentions within a document. Then extends to cross documents

Z: random variable that takes the value of the the index of an entity. X: collection of variables associated with a mention in the model (namely entity type T, numberN, gender G, head H, mention M).

Unsupervised Coreference Resolution in a Nonparametric Bayesian Model

Dataset	Num Docs.	Prec.	Recall	\mathbf{F}_1

Table 2: Formal Results: Our system evaluated using the MUC model theoretic measure Vilain et al. (1995). The table in (a) is our performance on the thirty document MUC-6 formal test set with increasing amounts of training data. In all cases for the table, we are evaluating on the same thirty document test set which is included in our training set, since our system in unsupervised. The table in (b) is our performance on the ACE 2004 training sets.

Unsupervised Models for Coreference Resolution

- Conceptualize the problem as inducing coreference partitions on unlabeled document instead of mention pair classification
- Modified Expectation-Maximization (EM) algorithm, so the number of cluster does not have to be predetermined

Given a document D, a clustering C, let θ be the model parameters.

E-step: Compute the posterior probabilities of the clusterings, $P(C|D, \theta)$ based on the current θ .

M-step: Using the value of $P(C|D,\theta)$ computed in the E-step, find the θ' that maximizes the expected log-likelihood: $\sum_{C} P(C|D,\theta) log P(D,C|\theta')$.

Unsupervised Models for Coreference Resolution

Joint Determination of Anaphoricity and Coreference Resolution using Integer Programming

- Using Integer Linear Programming (ILP) to optimize and join together multiple classifiers in coreference
- Model anaphoricity and coreference as a joint task
- Become intractable unless using pairwise independence assumption

System		BNE	EWS		NPA	PER		NWIRE			
	R	P	F	R	P	F	R	P	F

Joint Determination model using Integer Programming	69.2	78.9	62.1

Deterministic Coreference Resolution Based on Entity-Centric, Precision-Ranked Rules

Overview

- A entity-centric coreference model
 - Each decision can be globally informed by previously clustered mentions and their shared attributes
- Using solely simple deterministic rules
- A highly modular system to provide flexibility
 - Lack of language-specific lexical features (language independent)
- Maintain the balance of high precision and recall

Mention Detection

- Value high recall over high precision
- Mark all NPs, pronouns, and name entity mentions
- Apply exclusion rules to remove unwanted mentions i.e.
 - Numeric entities
 - Pre-defined dictionary (i.e. American, hmm, etc.)
 - Partitive or quantifier expression (i.e. none of...)

*** The rules might change depending on the corpus annotation

Coreference model

Mention Selection in a Given Sieve

- Take advantage of the partially clustered mentions
- Look at only the the first mention of each cluster to minimize error

$$\{m_1^1, m_2^2, m_3^2, m_4^3, m_5^1, m_6^2\}$$

- Further prune the search space with a model of discourse salience
 - Disable coreference for ambiguous pronouns/articles (some, other, a, an, etc.)

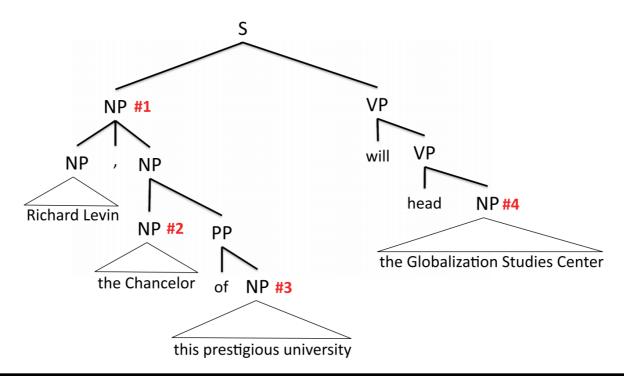

Coreference model

Antecedent Selection for a Given Sieve

- Recursively find all possible antecedents
- Antecedents are sorted based on their textual proximity to the anaphoric mention
- The selection stops when a match is found

Coreference model

Feature Sharing in the Entity-Centric Model

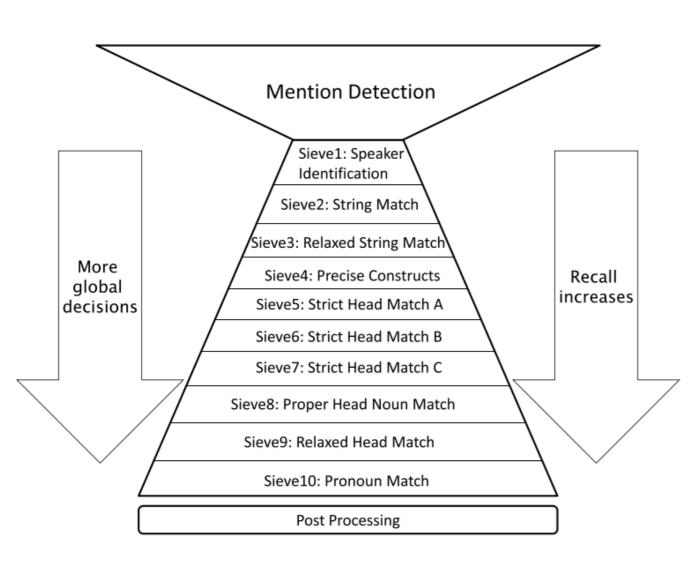

- Merge all mention attributes as a joint, shared attributes for the cluster to be more inclusive for later resolution
- To avoid negligence of correct links due to missing or mismatch attributes

```
For example:
```

```
a group of student: { singular }
five students : { plural }
a group of student <- five students: { singular, plural }</pre>
```

Coreference sieves

Sieve 1. Speaker Identification

Sieve 2. Exact String Match

Sieve 3. Relaxed String Match

Sieve 4. Precise Constructs

Sieve 5-7. Strict Head Match A-C

Sieve 8. Proper Head Match

Sieve 9. Relaxed Head Match

Sieve 10. Pronoun Resolution

Post processing

- Implementations of several transformations
- Ensure the output of the model matches the annotation specification of corresponding corpus

Performance

- CoNLL '11

Table 4

Performance of the top systems in the CoNLL-2011 shared task. All these systems use automatically detected mentions. We report results for both the closed and the open tracks, which allowed the use of resources not provided by the task organizers. MD indicates mention detection, and gold boundaries indicate that mention boundary information is given.

Topics yet to be Explored

- Common noun coreference resolution
- Coreference resolution with NER integration
- Wildcard pronoun coreference resolution
- Object hierarchy handling (i.e. gems, diamonds, rubies)

Wildcard Pronoun Resolution

- I. Relatives & Superlatives
 - Tome gives more than Sam.
 - What is the smallest?
- II. Quantity Modifiers
 - He gave <u>3</u> to Jessica.
 - Henry has none.
- III. Abstract Quantities
 - I have only a little.
 - He ate a few.

IV. Unit-like Pronouns

- Johnny has the same amount as Mike
- She only received a portion
- V. Inclusive & Status Pronoun
 - We have the rest.
 - They brought home the <u>remaining</u>.
